**FAQ/TROUBLESHOOTING TIPS**

Please be sure to visit our website at www.ipong.net and register your iPong robot when you purchase it to activate your warranty. If you experience a usage issue with your unit, you can go through our list of common issues and their solutions below. If you problem persists, please email info@ipong.net.

**Ball Feeder Motor not running?**

- Check to see that the A/C adapter is plugged in all the way.
- Unplug A/C adapter. Take the Ball Feeder Plate off to see if there are obstructions (dust, fuzz, hair, etc.) keeping the motor from spinning.
- Remove any obstructions, re-attach A/C adapter and try again.

**Rubber Wheels not spinning?**

- Check to see that the A/C adapter is plugged in all the way.
- Unplug A/C adapter. Remove top and bottom covers. Remove front plastic casing by pressing the top and bottom tabs. Check to see if there are any obstructions (dust, fuzz, hair, etc.) keeping the rubber wheels from spinning. Remove and obstructions, re-attach A/C adapter and try again.

**Balls hitting the side of the discharge hole?**

- Be sure you are using the correct size balls. iPong robots work only with 40mm table tennis balls.

**Balls falling out, not shooting?**

- Be sure you are using the correct size balls. iPong robots work only with 40mm table tennis balls.

**Balls shooting out at different angles?**

- Be sure you are using the correct size balls. iPong robots work only with 40mm table tennis balls.

**Balls not shooting at consistent speed?**

- Check to see that the A/C adapter is plugged in all the way.

**Robot won’t turn on?**

- Be sure batteries still have a charge.
- No change in speed when remote dials are turned?

- The speed does not increase or decrease. The remote dials only change the ball frequency, meaning how many the balls come out consecutively.

**Balls shooting off the end of the table?**

- Be sure you are using the correct size balls. iPong robots work only with 40mm table tennis balls.
- Try backing the iPong as close to the edge of the table.

**Balls are loaded but rotating plate isn’t moving.**

- Remove some of the balls from the top feeder. Overloading the top with balls may be too heavy for the plate to rotate.

**Balls getting jammed?**

- Be sure you are using the correct size balls. iPong robots work only with 40mm table tennis balls.
- Be sure that you are not exceeding the maximum ball capacity that the iPong can hold; maximum capacity is 160 balls.
- If the issue still exists try lessening the amount of balls that you put into the iPong to slab of 175 balls.
- If the entry cut-out on the agitator plate stops directly above feeder hole, it will allow multiple balls to enter into the feeding chamber and will cause jamming. To prevent this, avoid turning the entry cut-out with the feeder hole aligned.
